Abstract

The chemical constituents of *Angelica decursiva* (Miq.) Franch. & Sav., *Peucedanum praeruptorum* Dunn and *Anthriscus sylvestris* (L.) Hoffm., papers were investigated and compared. Papers were searched through electronic bibliographic databases with search terms and the chemical constituents were classified by chemical structures. Most constituents were dihydroxanthyletin structures in *A. decursiva* and dihydroseselin structures in *P. praeruptorum* which were coumarin-based structures. *A. sylvestris* showed lignan-based constituents in many literatures, of which dibenzyl butyrolactone structures were mostly reported. *A. sylvestris* must be differentiated from *A. decursiva* and *P. praeruptorum* due to its difference of chemical constituents.

Keywords: Chemical constituents, *Angelica decursiva*, *Peucedanum praeruptorum*, *Anthriscus sylvestris*

서론

前胡는 산형과(繖形科; Apiaceae) 식물인 바디나물(紫花前胡) *Angelica decursiva* (Miq.) Franch. & Sav. (= *Peucedanum decursivum* Maxim.) 또는 흰꽃바디나물(白花前胡) *Peucedanum praeruptorum* Dunn이다. *Angelica decursiva*는 원산지는 중국과 일본이다. *Peucedanum praeruptorum*은 원산지는 중국과 일본이다. *Anthriscus sylvestris*는 원산지는 유럽과 북아메리카이다.

uptorum Dunn의 뿌리로 化痰止咳平喘藥으로 분류되고 微寒苦辛하면서 肺에 歸經하고 祛痰降氣, 宣散風熱하는 효능을 지닌다.

하지만 실제 국내 약재 유통 상에서는 식물명이 전호인 峨參 *Anthriscus sylvestris* (L.) Hoffm. (繖形科; Apiaceae)가 前胡(또는 土前胡)로 유통되고 있다. 峨參은 补益藥으로 분류되고 微溫甘辛하면서 脾胃肺에 歸經하고 益氣健脾, 活血止痛하는 효능을 가지고 있기 때문에 前胡와는 구별되어야 하는 약재이다. 峨參이 명확한 약효 상 구분 없이 前胡로 사용될 경우 본래 前胡를 통해 발휘하고자 했던 祛痰降氣, 宣散風熱의 효능이 발휘되지 않거나 오히려 다른 효능 또는 부작용이 발생할 가능성이 충분히 존재한다.

따라서 본 연구에서는 紫花前胡, 白花前胡, 峨參으로 기원이 확인된 약재 및 시중에서 '전호'로 유통되는 약재에 대해 문헌에 보고된 구성 화학 성분 비교를 통해 한약재인 前胡와 峨參의 차이점을 밝히고 전호류 약재의 올바른 사용에 대한 필요성을 제시하고자 하였다.

3. 고찰

전호류 약재에 관해 기존에 보고된 연구 문헌을 수집·분류하여 기원 약재의 구성 화학 성분을 정리한 결과 약재 간 구성 성분의 차이점을 확인할 수 있었다.

紫花前胡의 경우 보고된 구성 성분이 대부분 coumarin을 기본 골격으로 하는 화학 구조를 보였다. 이를 세분하여 하위 골격 구조와 작용기별로 구분하면 비교적 많은 문헌에서 보고된 성분인 decursin과 decursidin 등이 속해 있는 dihydroxanthyletin 계열, 그리고 nodakenetin과 nodakenin 등이 속해 있는 dihydropsoralen 계열, 그 밖에 psoralen 계열과 dihydrooroselol 계열, hydroxycoumarin 계열로 크게 분류할 수 있었다. 이 중 dihydroxanthyletin 계열은 가장 많은 성분이 속해 있는 구조로 xanthyletin을 기본 골격으로 하고 3', 4' 탄소 위치에 각각 수소가 1개씩 결합되어 있는 형태를 나타낸다. 그리고 여기에 결합되는 작용기는 대부분 angeloyloxy, senecioyloxy, acetoxy 등이 있었고 이들은 모두 산소가 결합된 형태로 기본 구조에 연결되어 있었다.

白花前胡의 경우 紫花前胡에서와 마찬가지로 coumarin을 기본 골격으로 하는 화학 구조가 대부분을 차지했고, benzoic acid, terpene 등의 구조를 가진 화합물도 소수 보고되었다. 白花前胡에서 보고된

coumarin을 세부 하위 골격 구조와 작용기별로 분류해보면, 많은 문헌에서 보고된 성분인 praeruptorin A (Pd-I a), praeruptorin B (Pd-II) 등이 속해 있는 dihydroseselin 계열이 가장 많은 비중을 차지하였고, umbelliferone이 속해 있는 hydrocoumarin 계열, dihydropsoralen, psoralen, dihydroangelicin, angelicin, dihydroxanthyletin 계열 등으로 분류할 수 있었다. 이 중 dihydroseselin 계열은 seselin을 기본 구조로 하여 3', 4' 탄소에 각각 수소가 1개씩 결합된 형태를 나타낸다. 여기에 결합된 작용기는 angeloyloxy, senecioyloxy, tigloyloxy, acetoxy, isovaleryloxy, propionyloxy 등 紫花前胡에 비해 다양한 것으로 확인되었다.

峨參의 경우, 紫花前胡나 白花前胡와는 전혀 다르게 lignan과 phenylpropanoid를 기본 골격으로 하는 화학 성분들이 주로 보고되었고, coumarin 계열 성분은 白花前胡에서 보고된 5가지 성분들이 존재하는 것으로 확인되었다. 峨參에서 보고된 lignan 계열의 성분은 가장 많은 문헌에서 보고된 nemerosin과 yatein이 포함된 dibenzyl butyrolactone을 기본 골격으로 하는 계열과 deoxypodophyllotoxin (anthricin)이 포함된 aryltetralin을 기본 골격으로 하는 계열로 분류되었다. 이 중 dibenzyl butyrolactone은 γ -butyrolactone을 기본 구조로 하여 여기에 benzyl기가 2개 결합된 형태의 화학구조 혹은 2개의 phenylpropanoid가 8, 8' 탄소에서 결합한 형태를 나타내는 것으로 볼 수 있다.

紫花前胡와 白花前胡 모두 coumarin을 기본 골격으로 하는 화학 성분들이 보고되었으나, 紫花前胡에는 dihydroxanthyletin 계열의 성분이 주로 보고되었고, dihydropsoralen 계열과 psoralen 계열 등의 성분이 보고된 반면, 白花前胡에는 dihydroseselin 계열의 성분이 주로 보고되었고, hydrocoumarin 계열, dihydropsoralen 계열 등의 성분이 보고되었다. 이 중 dihydropsoralen 계열은 紫花前胡, 白花前胡에서 모두 보고되었으나 nodakenin과 nodakenetin을 제외하면 서로 일치하는 성분이 없었다.

Coumarin을 기본 골격으로 하는 성분이 주로 보고된 ‘前胡’류 약재와는 달리 峨參에서는 lignan과 phenylpropanoid 골격 등 기본골격에서부터 일치하는 성분이 거의 없었다. Coumarin은 그 자체가 기본 골격이 되어 여기에 여러 가지 구조의 작용기가 결합함으로써 다양한 특성을 나타내는 물질이고, lignan은 phenylpropanoid를 기본 골격으로 하여 이들 phenylpropanoid가 2개 이상 결합된 형태를 존재하며 다양한 작용기가 결합하게 된다. 따라서 문헌에서 보고된 화학 성분을 통해 각 기원약재를 비교한 결과, 紫花前胡와 白花前胡는 峨參과 뚜렷한 구분점이 있는 것으로 확인되었다.

결론

紫花前胡, 白花前胡, 峨參의 성분에 대한 문헌연구를 수행한 결과, 紫花前胡와 白花前胡 모두 coumarin을 기본 골격으로 하는 성분들이 대부분 보고되었고, 이 중 紫花前胡에서는 dihydroxanthyletin 계열이, 白花前胡에서는 dihydroseselin 계열의 성분이 주로 보고되었다. 峨參에서는 lignan을 기본 골격으로 하는 성분들이 대부분 보고되었고, 이 중 dibenzyl butyrolactone 계열의 성분이 주로 보고되었다.
